

Translating Documents Without Losing Layout

A practical guide for operations teams - 2026 edition

Why it matters

Large language models have changed how organisations handle multilingual documents. Instead of sending every contract to an agency, teams can now produce a **first-pass translation** in minutes and route only the sensitive sections to human reviewers.

The hard part is not the translation itself but the *layout*. Invoices, brochures and scientific papers mix columns, tables, captions and footnotes, and readers expect the translated file to look exactly like the original.

How the pipeline works

Our pipeline keeps every vector graphic, image and background in place and replaces only the text, so tables keep their borders and shading.

Text expansion is the main risk: German or French output is often thirty percent longer than English. The renderer first grows each box into free space, then shrinks the font within a safe limit, and finally asks the model for a shorter phrasing when nothing else works.

Quarterly results by region

Region	Revenue	Growth	Comment
North America	\$4.2M	+12%	Strong demand from healthcare customers
Europe	\$3.1M	+8%	New office opened in Berlin
Asia Pacific	\$2.7M	+21%	Fastest growing market this year
Latin America	\$0.9M	-3%	Currency headwinds offset new deals

Note: figures are unaudited and rounded to one decimal place.
